

# CommonTime mSuite5 v5.12: Release Notes

This version can be used for new mSuite5 installations or for upgrading existing mSuite5 installations. It can NOT be used to upgrade existing mSuite 4.3.x installations.

If you are currently using mSuite version 4.3 (or earlier), please contact CommonTime (or your accredited CommonTime partner) to plan your upgrade to mSuite5. Please note, however, that support for mSuite version 4.x ceased on December 31st, 2009.

The platform sections below indicate where each new function and/or fix has been implemented – not necessarily where it takes effect. For example, a change to a server software module can affect client behaviour and vice versa. The objective of the sections below is to indicate where the upgrade must be applied to realize the new functionality or fix. You should, however, always upgrade all server(s) before upgrading any clients (mobile devices).

NOTE: These release notes relate solely to this version - they do not include new functionality or bug fixes that were shipped in earlier versions of mSuite5.

## New Functionality

### mSuite clients

#### Symbian Series 60 3rd Edition client

- No new functionality in this version.

#### Windows Mobile client

- No new functionality in this version.

### Exchange Adapter (for Exchange ActiveSync clients)

- Support for Motorola Droid.
- Support for Google Nexus One.

### Other Server Software and Administration

- [5312] The CMS can now be configured to attach to Notes/Domino so that, in the event of a CMS crash, an NSD log file is produced to assist in identifying the cause. This is controlled by registry settings – contact CommonTime technical support for details.
- [5317] The CMS now has an option to disable 'referrals' during LDAP authentication as required by later versions of Active Directory. This is controlled by a registry setting – contact CommonTime technical support for details.

## Fixes

### mSuite clients

#### Symbian Series 60 3rd Edition client

- No fixes in this version.

#### Windows Mobile client

- No fixes in this version

### Exchange Adapter (for Exchange ActiveSync clients)

- [5247] A multi day all day event created in Notes only displayed on the first day on the mobile device.
- [5264] Improvements to minimize the occurrence of resets due to stale sync status information.
- [5272] Corrupt Lotus Notes calendar entries were sent to the mobile device repeatedly resulting in excessive battery drain.
- [5275] If a user's 'day ticket' was rejected by the mNotes server, the Exchange Adapter did not re-authenticate resulting in failed sessions.
- [5290] Meetings with irregular/custom repeat patterns could be sent to the chair's mobile device repeatedly resulting in excessive battery drain.

### Other Server Software and Administration

- [5241] Data Replication server would sometimes attempt to delete items twice.
- [5248] Fixed a problem that caused the mNotes server to crash if RMI raised an exception in the Session destructor.
- [5283] Fixed a memory leak in the CMS that occurred during user authentication.
- [5284] Fixed a leak of Crypto API resources in the Configuration server.
- [5315] Fixed a CMS crash.
